

Product Infusion Treatment: Post-Procedure Care

1. Treatment Area Healing:

a. The treatment area will be slightly pink or sting for a couple of hours. Some skin stays mildly pink for 24 to 48 hours. Should you have redness that is more intense, or last more than 48 hours, please call the office.

b. The treatment area may be slightly irritated like being out in the sun. This may last from no days to 3-5 days. Follow the instructions below. Should the irritation be more intense, or last longer than 3-5 days, please call the office.

2. Avoid: Sun exposure. Wear a sunscreen with an SPF 30 UVA/UVB protection.

3. Make-up: Can be worn immediately following the procedure, though to maximize product absorption and penetration into the skin cells, it is best to avoid make-up application for 24 hours.

4. Post-treatment skin care:

a. Apply an "approved" moisturizer and cleanser each morning and night for three to five days following the treatment. Available for purchase at the office is Replenix Green Tea Soothing Cleanser, ELTA MD AM Therapy and/or ELTA MD PM Therapy

b. Wear sunscreen with a SPF 30 that includes both UVA and UVB protection.

c. Skin rejuvenation products (such as Retin-A, Renova, Vitamin C, Glycolic acid, Alpha Hydroxy acid, etc.): Avoid using them on the treatment area for two to five days following the procedure. Also avoid waxing, electrolysis, and chemical depilatories for 14 days post procedure.

d. The nurse will circle below the particular "speciality" product infused during your procedure today:

Vitamin C Serum

Retinol Serum

Facial Firming Therapy and Dermal Restructuring Therapy

e. Other non-rejuvenation skin care products (such as cleansers, moisturizers, etc.): Most people can tolerate using these products that evening, and thereafter as directed. If they seem to sting or make your skin irritated, then you should avoid using them until tolerated
